AB A **cylindrical reactor** is described for treating phosphate rock with H_2SO_4 , removing $CaSO_4$, and collecting H_3PO_4 . The reactor has 1 **vertical** sinusoidal-shaped, 1 **vertical** circular, and a **vertical** partition of different heights which sep. it into 3 compartments: the 1st compartment is the mixing chamber, the 2nd is the **reaction chamber** which is cooled with air, and the 3rd is the $CaSO_4$ crystallization chamber.

AB A reactor is described for the high-speed manufacture of fine homogeneous carbon blacks from hydrocarbon feedstocks. Preheated pressurized air is fed into a **vertical** chamber and passed into horizontal pipes which contain burners which are fed with fuel and lead into a horizontal cylindrical chamber of diameter greater than its length where complete burning of the fuel with excessive air occurs. The combustion chamber contains a nozzle for optional injection of feedstock and the combustion products are fed to a **reaction chamber** through a horizontal narrow connecting chamber surrounded by a cooled protective diaphragm which prolongs the service life of the reactor. Feedstock is injected into the gases flowing through the connecting chamber and thermooxidative decomposition of the feedstock occurs in the horizontal **cylindrical reactor** which contains nozzles for spraying coolant and has a diameter intermediate between that of the combustion and connecting chambers.

AB A continuous process for hydroformylation of C₂6
olefins with synthesis gas in the presence of homogeneous catalyst
is carried out in a vertical cylindrical reactor the
inner volume of which is divided in ≥ 2 consecutive compartments. The
olefins together with synthesis gas are introduced at the lower
end of the 1st compartment whereas the mixture containing partially converted
reaction components flows from the top toward the bottom of the
compartment. The olefins are withdrawn from the top of the last
reactor compartment. The process is illustrated by means of a math.
simulation based on a kinetic model for hydroformylation of
polyisobutene. Cross-sectional drawings illustrating a
cylindrical reactor are included.
